

### New Belly Board system available from OIS

New to UK market this year is the Koilia-Mikros Belly Board system for the treatment of pelvic cancers. Available through immobilisation specialist Oncology Imaging Systems Ltd. and manufactured by CDR Systems Inc. in the US, the Koilia-Mikros board takes its name from the Greek *koilia*, meaning abdomen and *mikros*, meaning small and is already generating plenty of interest in clinical departments.

Made of easy to clean, radio-translucent and lightweight materials, the Koilia-Mikros board consists of an adjustable stabilisation platform that provides accurate positioning while minimising uncomfortable pressure points. The base has a caudal aperture, positioning scales on either side and is indexable to the treatment couch with 2 indexing bars at the front and back. Different size and density interchangeable support modules for the belly, small bowel and head and chest, allow for customisable patient set-up. These multiple configurations provide optimal anatomical placement of both external and internal anatomy for improved clinical outcomes.

CDR Systems Inc. is a manufacturer of patient immobilisation technology. Their ergonomically designed systems use cutting-edge techniques, materials and processes that meet the highest standards for quality and durability, that allow patients to receive precise and repeatable positioning during radiation therapy. Oncology Imaging Systems Ltd is the sole UK distributor of CDR Systems Inc.

**For more information on the Koilia-Mikros Belly Board System and all our patient positioning and immobilisation devices, please contact Oncology Imaging Systems Ltd., tel. 01825 840 633 fax. 01825 841 496 [sales@oncologyimaging.com](mailto:sales@oncologyimaging.com) [www.oncologyimaging.com](http://www.oncologyimaging.com)**
