Patient Admission Terminal

Integrated solutions for workflow optimisation

The OPASCA Workflow Management Suite simplifies the complex clinical routine. It ensures that all processes are interconnected and run more efficiently, leaving more time for individual and focused patient care. From digital patient check-in to transparent, data protection-compliant management of waiting times and patient calling; from communication with your patients via app to an intuitive patient guidance system: OPASCA provides integrated, holistic solutions to optimise your workflow.

About OPASCA

OPASCA offers modular all-in-one solutions for safe, efficient and smooth processes in everyday clinical routines. Together with you, we create the optimal clinical workflows for your facility through standardisation and automation.

We offer tailor-made solutions that intelligently connect and network all people and components involved in treatment.

OPASCA Patient Pass

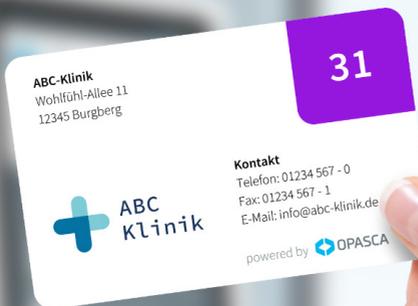

The OPASCA Patient Pass enables clear identification and calling of patients during the entire clinical stay, with individual colour-number combinations to ensure data protection compliance. The patients can check in and out independently with their pass. Thanks to real-time data transmission, staff have an overview of patient status and location at all times.

OPASCA Patient Check-In

With the OPASCA Patient Check-In, patients can independently check in and out each time they visit the clinic by simply holding their personal patient pass with integrated RFID technology against the scanner. Patients can see an overview of upcoming appointments and, optionally, make requests via the touch screen. Staff receive all information in real time and can see which waiting area the patient is in.

OPASCA Patient Admission Terminal

The OPASCA Patient Admission Terminal is a freestanding terminal for patient check-in with additional functionality such as issuing the Patient Pass and digital document capture.

OPASCA Infotainment

OPASCA Infotainment makes waiting times pleasant and varied for patients. Patients can be provided with relevant hospital information in real time or entertained with video sequences. Optionally, an individually configurable ticker communicates current delays or service messages. The simplicity of operation and improved transparency reduces staff workload and improves patient experience.

OPASCA Patient Calling

OPASCA Patient Calling is initiated by the staff in the control room. Both the audible call and the visual display on the waiting room infotainment use the patient's individual colour-number combination. The call is therefore completely anonymous and conforms to data protection regulations. The automation of the process enables faster treatment procedures and optimised patient guidance.

OPASCA Patient Guidance

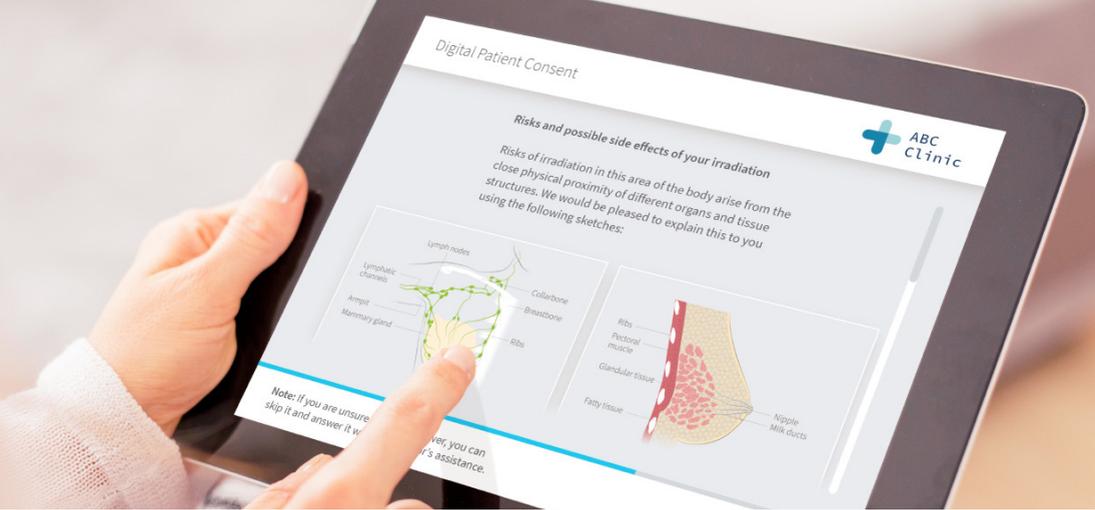

OPASCA Patient Guidance reliably navigates patients to the next treatment destination via their personal colour-number combinations. Control of the guidance system takes place automatically when the patient is called up. By automating the patient's journey from the waiting room, the system offers a significant reduction in staff workload. Large, intuitive displays provide comprehensive guidance throughout the department, ensuring patients find their destinations quickly and without detours. When the appointment is complete, staff can select guidance for an onward destination or exit. The system helps to optimise workflows and relieve stress for both patients and staff.

OPASCA Patient Companion App

Bidirectional communication with patients via app including appointment overview, taxi call, route directions, patient reported outcome (PRO) and digital aftercare.

The OPASCA Patient Companion App accompanies patients before, during and after the treatment process. Patients always have an overview of their personal appointments and have their treatment progress at hand. Information and contact details of the clinic can be called up at any time. Staff can easily communicate schedule changes via push messages. Unnecessary waiting times can be avoided and patient autonomy strengthened.

OPASCA Digital Patient Consent

With OPASCA Digital Patient Consent, patients can familiarise themselves in advance and read through questionnaires to prepare for treatment, highlighting any open questions. Fast and reliable integration of forms provides increased efficiency and supports optimised, paperless hospital processes.

Clear anatomical drawings and digital processing options facilitate clarification on risks and side effects. Additional information can be added electronically as required. Then, the documents can be digitally signed in a secure manner. The system warns if consent is not available before the first treatment session.
